Description of project

- Profiles, feed page, music and art uploads, following other creators, messaging, auctioning art.
- The project took on a life of it's own and evolved organically
- More interactive posts, user search, profile photos.

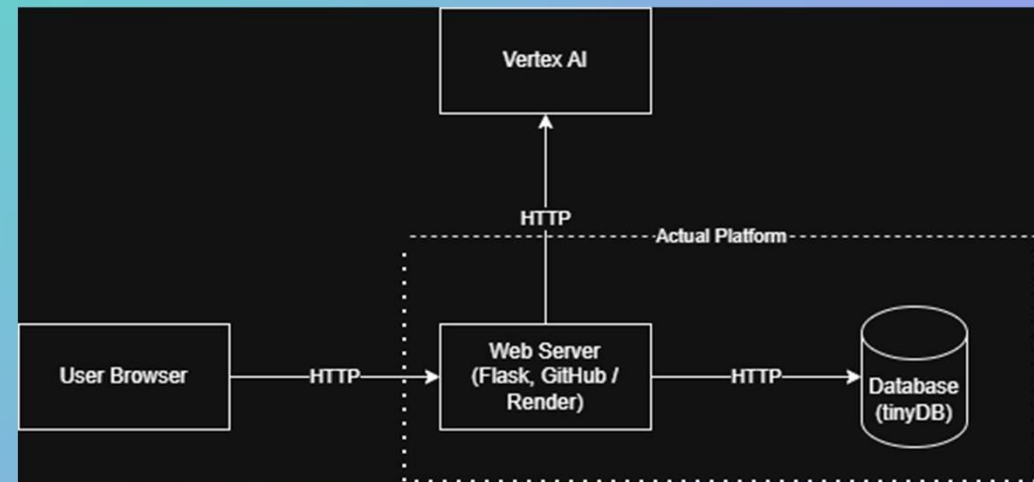

Final Architecture

Our original plan was to incorporate either a Venmo or PayPal account so users could purchase other users' content or have the ability to auction off their work. We decided to move that feature out of scope, so the use of a banking component was no longer needed.

Along with flask, we also used a docker file to have Souly run on Render so we didn't need to have one of our computers running the site.

We decided to go a different direction with CSS. Rather than use the existing Bootstrap, we started from scratch to have our site's color scheme change depending on whatever category a user was in.

For our AI Detection, the API we originally wanted to use cost \$1,000 per month...so instead we decided to train our own AI to check a user's content.

Features and coming soon...

Features:

- Direct messaging
- Image/audio uploading
- AI art checker
- Music and Art feeds

Features not included:

- Auction
- PayPal/transactions

Out of scope for now...

- Listings to concerts
- art shows, and events
- Connect to Spotify
- AI music checker

Lessons learned

- Current Problem with AI checkers
- Estimated time was never accurate
- Working with other people's code was hard
- AI really helped with learning a brand new web dev stack
- None of us knew flask
- what would I change?

Demo time!

Now, we would like to show off some features we are most proud of
